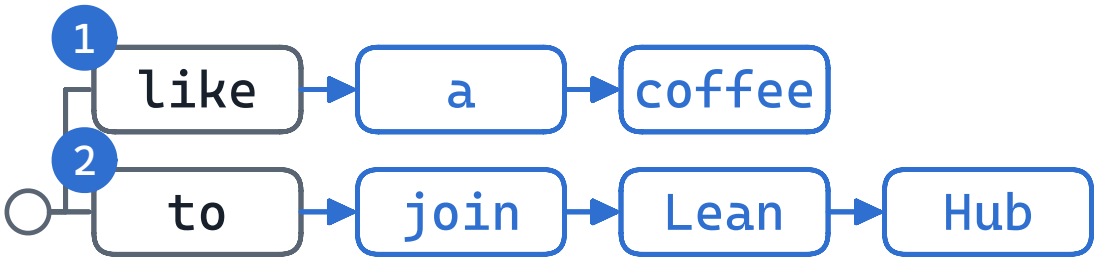
(a) Draft from suffix matches

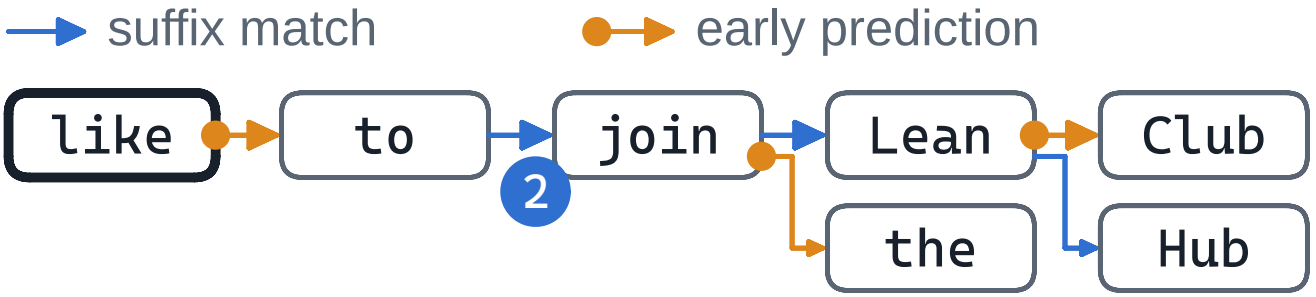
Step 1



The three positions on path 1 start together.

(b) Draft from early predictions

Steps 1–2



(c) Score and prune branches

Steps 1–3

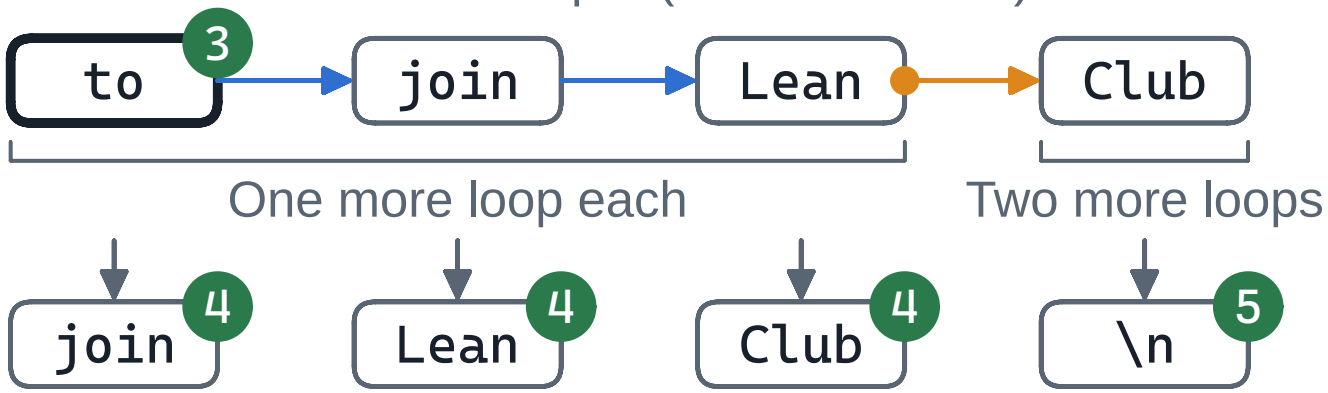
Child score = parent score × edge match rate

Prune a node's subtree if its path score ≤ τ.

(d) Verify and append tokens

Steps 3–5

Positions retained after step 3 (new root at left)



k Step when this token is appended to the output

Start a new tree if no child matches the greedy token.
